

# Treatment guideline for **adult patients with type 1 diabetes ?**

**Jae Hyeon Kim**

Division of Endocrinology and Metabolism,  
Samsung Medical Center,  
Sungkyunkwan University School of Medicine

ICDM 2014

# Treatment guideline for T1D

- No guideline for T1D in Korea (KDA 2011, 2013)
- ADA guideline
  - Standards of Medical Care in Diabetes 2014  
(Position statement)
    - Insulin therapy for type 1 diabetes
  - Type 1 Diabetes Through the Life Span: A Position Statement of the American Diabetes Association  
(Diabetes Care 2014;37:2034–2054)

# Contents

- Diagnosis and Classification
- Initial evaluation and follow-up
- Insulin regimen
- Glucose monitoring (SMBG & CGMS)
- Education
- Summary

# Halle Berry, T1D or T2D ?

She had collapsed on the of TV show "Living Dolls" and went into a diabetic coma in 1989, and shortly afterwards she was diagnosed with **type 1 diabetes**.

In 2007, she says, '**I've managed to wean myself off insulin**, so now I like to put myself in the **type 2 category**.'

**Atypical Diabetes (Flatbush diabetes)**  
= **Ketosis prone type 2 diabetes**  
- African American

# Newly diagnosed DM with DKA

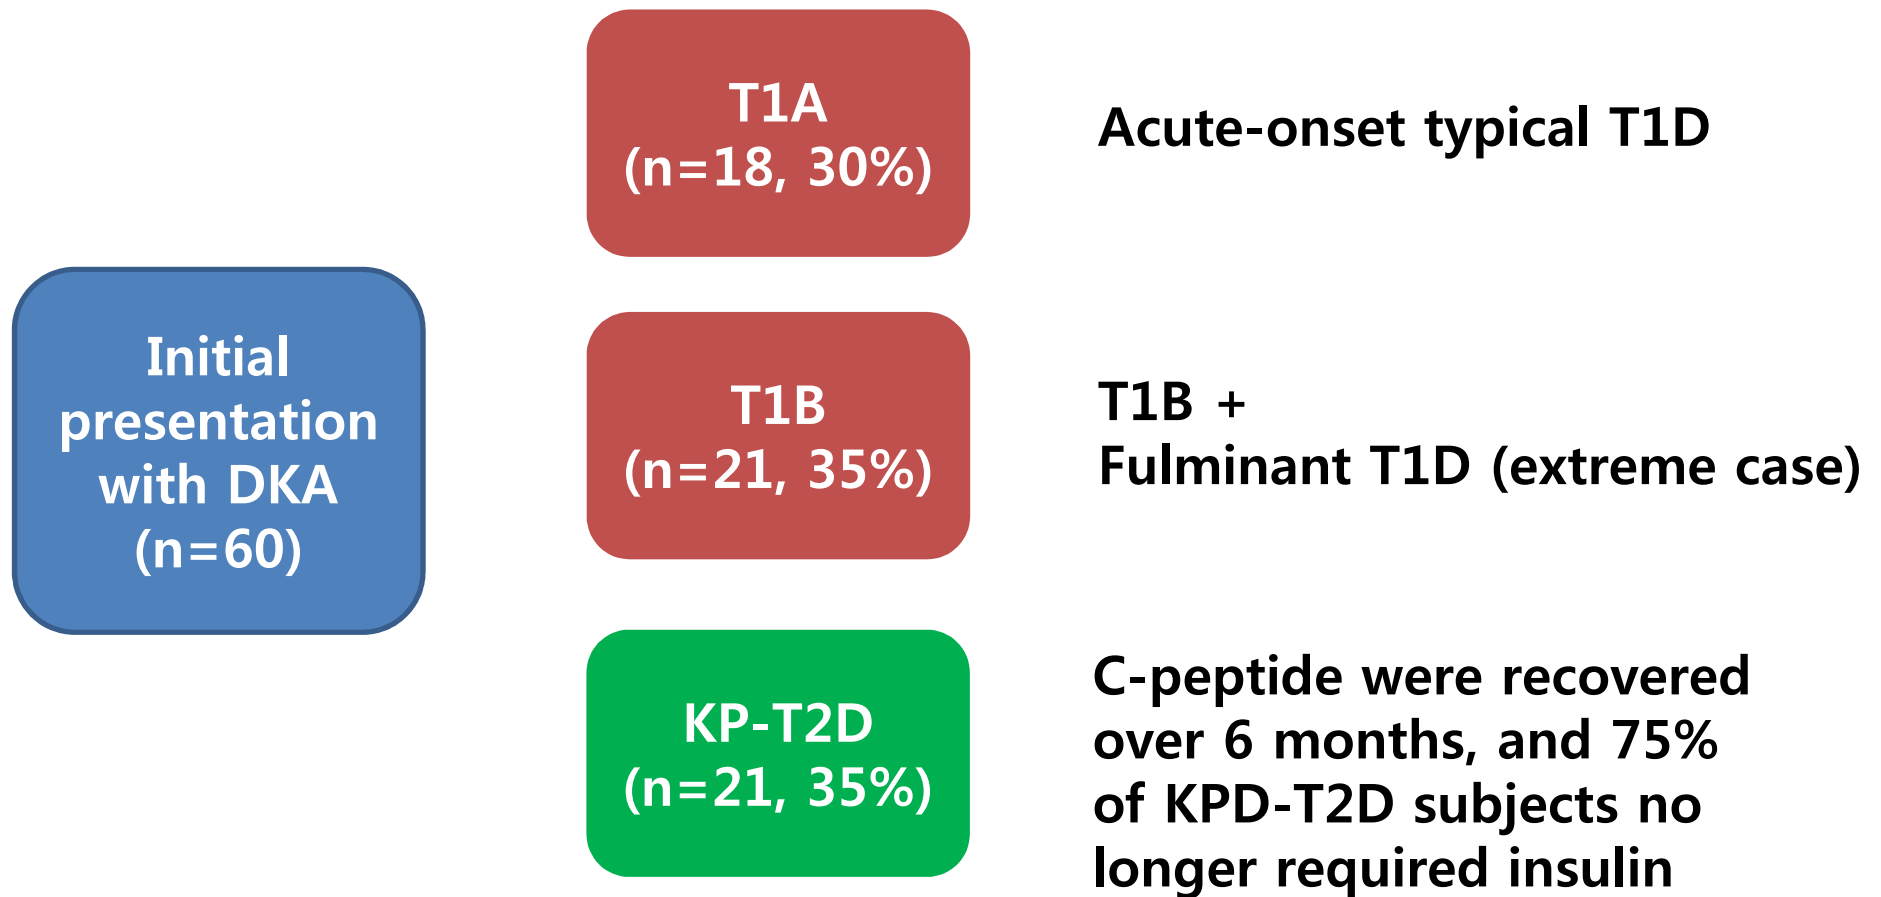

SMC, AMC, Severance

- 1) T1A: GAD (+)
- 2) T1B: GAD (-), fasting c-pep <1.0ng/dl  
– fulminant T1D  
: A1C < 8.5% & fasting c-pep <0.3ng/dl
- 3) KP-T2D: GAD (-), fasting c-pep  $\geq$ 1.0ng/dl

KP-T2D: ketosis prone T2D

# Clinical characteristics and insulin independence of Koreans with new-onset type 2 diabetes presenting with diabetic ketoacidosis

Seok H, DMRR 2013

# Classification of diabetes is not easy

## Tremendous variability in the initial presentation of T1DM

Autoimmune (+): Acute-onset typical T1D (T1A) vs. Early stage-LADA (T2D feature)

- 1) All five autoAbs are not available. 2) Ab titers diminish over time. 3) In Asians, autoAbs are often negative.

Long standing T2D (insulin dependent) vs. Slowly progressive T1D (late stage-LADA)

|                       | Beta cell function<br>: $\beta$ (+)   | Beta cell function<br>: $\beta$ (-)  |
|-----------------------|---|--|
| Autoimmune<br>- A (+) | Early stage-latent<br>autoimmune diabetes in<br>adult (LADA)<br>– T2D feature | Acute-onset typical T1D<br>(T1A)<br>Slowly progressive T1D<br>(=late stage-LADA) |
| Autoimmune<br>- A (-) | Ketosis prone-T2D<br>(Atypical diabetes)                                      | Fulminant T1D,<br>Acute-onset T1B,<br>long standing T2D ?<br>(insulin dependent) |

# Initial Evaluation and F-U

# Insulin regimens for T1DM (ADA 2014)

- Most individuals with T1D should be treated with multiple daily insulin injections (three or more injections per day of prandial insulin and one to two injections of basal insulin) or CSII. (A)
- Most individuals with T1D should use insulin analogs to reduce hypoglycemia risk. (A)
- Most individuals with T1D should be educated in how to match prandial insulin dose to carbohydrate intake, premeal blood glucose, and anticipated activity. (E)

# Hospital based Korean T1D registry

- **Five tertiary referral hospitals** (SMC, KBSMC, Severance, CMC, AMC)
- Subjects – **Patients with T1D who participated in strip refund program** (n=869)
- Inclusion Criteria: 1) and one of 2)
  1. Requiring insulin
  2. One or more of the following criteria
    - **Fasting C-peptide  $\leq$  0.6ng/ml**
    - **Stimulated C-peptide  $\leq$ 1.8ng/mL**
    - **History of DKA at initial diagnosis**
    - **Positive for GAD Ab, insulin Ab, or ICA**

Median (25% - 75%)

# Glycemic target in adults with T1D (ADA 2014)

- **Nonpregnant adults with T1D < 7%**
- **More stringent (A1C < 6.5%)**
  - Without significant hypoglycemia
  - Short duration, long life expectancy, hypoglycemic awareness, no significant CVD
- **Less stringent (A1C < 8.5%)**
  - History of severe hypoglycemia, hypoglycemic unawareness, limited life expectancy, advanced micro/macrovascular complications, extensive comorbid conditions

**Youth (<18 yrs): A1C < 7.5%**

Korean T1D registry

# SMBGs for T1D

## (ADA 2014)

- Glycemic controls should be assessed based on **frequent SMBG levels** (& CGM data, if available) in addition to A1C (A)
- Individuals with T1D need to have **unimpeded access to glucose test strips** for glucose testing (may require **≥ 10 strips daily** to monitor for hypoglycemia....) (B)
- **Increased SMBG frequency was associated with lower A1C**

# SMBG frequency and A1C (USA)

# Educations (DSME & DSMS)

- No matter how sound the medical regimen, **it can only be as successful as the ability of the individuals and/or family to implement it**
- Adult learning theory can be used to tailor DSME and DSMS to the age, life stage, culture, literacy/numeracy, knowledge, experience, and cognitive ability of the patient (C)

# Effective education and A1C level

\* p-value by Mann-Whitney test

Education effect (+): The patients answered the survey that they could modify their life style and adjust insulin dose after education

# Nutrition therapy

- **Individualized MNT** is recommended for all people with T1D as an effective component of the overall treatment plan (A)
- **Monitoring carbohydrate intake**, whether by **carbohydrate counting, or experience-based estimation**, remains a key strategy in achieving glycemic control (B)
  - Carbohydrate counting and meal composition
  - Education on the impact of protein and fat on glycemic excursions should be incorporated in diabetes management

# Education program for T1D

- DAFNE (Dose Adjustment For Normal Eating)
  - UK, Germany, Australia, New Zealand, Singapore

Promoting the '**expert patient**'

- 2030 CAMP in KDA
  - Diabetic patients with age 20-39
  - Biannually from 2004
  - n=546 (80% with age 20-39)

**Not specific for T1D**

# Summary

- **Increased SMBG frequency ( $\geq 5$ -7/day) was associated with lower A1C, and but mean frequency of SMBG in Korea is lower compared to USA.**
- **After coverage of insurance for glucose strip increase SMBG frequency and individuals with increased SMBG frequency reduced severe hypoglycemia & hypoglycemic unawareness**
- **Proportion of patients with intensive insulin regimen is still low in Korea [insulin pump (5%) and basal-bolus (65%)]**

# Summary

- **CGM** is effective to **reduce A1C** without increase in hypoglycemic risk in T1D.
- There are **still unmet needs for glycemic control, specific education program, insurance coverage of unlimited number of SMBG, CGM and insulin pump including SAP** in Korean adult patients with T1D

# Scent of a Woman's Ferrari Joy Ride
